1. Effect of Drugs on the Isolated Skeletal Muscle (Frog Rectus Muscle) ................................................................. 1
   - Effect of acetyl choline  1
   - Potentiating effect of physostigmine  4
   - Blocking effect of D-tubocurarine  4

2. Effect of Drugs on Isolated Smooth Muscle (Rat Colon) .................................. 8
   - Effect of acetyl choline  8
   - Potentiating effect of physostigmine  9
   - Blocking effect of atropine on isolated rat colon  10

3. Effect of Drugs on Isolated Smooth Muscle (Guinea Pig Ileum) ................................................................. 11
   - Effect of histamine  11
   - Blocking effect of antihistamine  12

4. Effect of Drugs on Rabbit’s Eye ............................................................................. 13
   - Miotic effect of physostigmine  13
   - Mydriatic effect of atropine sulphate on rabbit’s eye  16

5. Effect of Drugs on Ciliary Movement of Frog Esophagus ................................. 18
   - Effect of cholinergic drug  18
   - Effect of anticholinergic drug  20

6. Experiment to Evaluate Local Anesthetic Action .............................................. 21
   - Effect of local anesthetics on frog  21
   - Effect of local anesthetics on rabbit  22
   - Effect of local anesthetic on guinea pig  23

7. Action of General Anesthetics on Rats ................................................................. 24
   - Effect of volatile anesthetic drug  24
   - Effect of nonvolatile anesthetic drug  25

8. Action of Analgesics on Mice .............................................................................. 27
   - Effect of nonopioid analgesic drug  27
   - Effect of opioid analgesic drug  30
9. Chemical Test to Identify Drugs in Biological Solution .......................... 34
   - Identify drug by using chemicals  34
   - Identify drug by using animals  36

10. To Study the Effect of CNS Stimulants ................................................. 38
    - CNS stimulants in mice  38

11. To Study the Effect of CNS Depressants ............................................. 40
    - CNS depressants in mice  40

12. To Study the Effect of Drugs on Isolated Heart Preparation ................. 43
    - Isolated frog heart  43

13. Charts ................................................................................................. 46
    - Qualitative charts  46
    - Quantitative charts  50
    - Clinical pharmacology charts  54
    - Drug interaction charts  58
    - Prescription audit charts  63
    - Pharmaco economic charts  66
    - Dosage calculation charts  68
    - Pharmacy charts  71
    - Prescription writing charts  73

14. Bioassay: Graded Dose Response Curve ............................................. 77
    - Interpolation method of assay—
      in isolated skeletal muscle—frog rectus  79
    - Two-point or matching assay in isolated
      smooth muscle of rat colon  83
    - Three-point assay in isolated smooth muscle—
      guinea pig ileum  85
    - Four-point assay in isolated smooth muscle—
      guinea pig ileum  88

15. Cumulative Dose Response Curve .......................................................... 90
    - Agonistic effect of ACh  90
    - Potentiating effect of physostigmine  91
    - Antagonistic effect of atropine  91

16. Identification of Drug Using Isolated Heart Preparation ....................... 93
    - Isolated frog heart  93
17. Effect of Digoxin on Hypodynamic Heart Preparation ............................................. 100
   ◆ Digoxin on hypodynamic frog heart 100

18. Chemical Test to Identify Drugs in Biological Solution and on Living Animals (Intact Animals) ................................................................. 101
   ◆ Effect of alkaloids 101
   ◆ Effect of morphine on animals 102
   ◆ Physostigmine 103
   ◆ Atropine 106
   ◆ Ephedrine 109
   ◆ D-tubocurarine 111
   ◆ Strychnine 113
   ◆ Effect of phenothiazine 114
   ◆ Effect of phenobarbitone 116

19. Evaluation of Unknown Drugs by Using Small Techniques ........................................ 122
   ◆ Rotarod 122
   ◆ Actophotometer 123
   ◆ Elevated + Maze 124
   ◆ Staircase apparatus 125
   ◆ Hole board apparatus 126
   ◆ Sliding apparatus 127
   ◆ Pole climbing apparatus 128
   ◆ Mirror chamber 129

20. Some Standard Techniques ................................................................................ 131
   ◆ Collecting blood from mice 131
   ◆ Collecting blood from rabbit 131
   ◆ Collecting blood from rat 131
   ◆ Intragastric administration in mouse 132

21. Charts .................................................................................................................. 133
   ◆ Effect of drugs on the blood pressure of dog 133
   ◆ Effect of drugs on the intestinal movements of dog 140
   ◆ Effect of drugs on respiration of dog 142
   ◆ Toxicology 144
   ◆ Drug interactions 148
   ◆ Clinical pharmacology 149

Index ......................................................................................................................... 155
Pharmacology is the study of the effects of drugs on living organisms. It includes the biological actions of chemicals and the mechanism of action. We should be able to describe and quantify both the desirable and undesirable effects in laboratory animals and such observations can be extrapolated to the human beings. Experimental pharmacology thus helps in understanding the nature of drug action in therapeutic form and in toxicological aspects. The experiments can be carried out in intact animal or in isolated tissues.

In whole animal experiments (e.g. dog, mice, rabbit, etc.), the effect of drugs on the organs are influenced by many factors such as blood supply, metabolism, distribution, nervous control, hormonal influences, bioavailability, etc.

In isolated preparations, the direct mechanism of action of drug can be studied. Moreover, this is cheap and can be studied for different drugs on different types of tissues by sacrificing one animal.

Laboratory animals can be bred and maintained in the laboratory under suitable conditions. The common laboratory animals are mice, rat, guinea pig, frog, dog and rabbit.

All animals as a rule should be handled in humane method. Animals should be in no case suffer from pain. The health of the animals should be maintained. When they are sacrificed, the approach should be euthanasia (painless death).

The Prevention of Cruelty to Animal’s Act of 1960 provided for the constitution of a committee to oversee the conduct of experimentation of animals. The CPCSEA (Committee for the Purpose of Control and Supervision of Experiments on Animals) was established under that provision. The Experiments on Animals (Control and Supervision) Amendment Rules (1998) and the Breeding of the Experimental Animals (Control and Supervision) Rules (1998) gave power to the CPCSEA to make rules in relation to the conduct of experiments on animals, the power to authorize any of its officers to inspect any place (at any time), and the power to prohibit a person or any institution from carrying out experiments on animals. Mrs Menaka Gandhi, a former minister and an animal right activist of repute, took over as its chairperson and brought out sweep changes in the manner in which animal experiments were being conducted in the country. The guidelines made it clear that all laboratories doing animal work had to be registered with the CPCSEA and had to follow a set of rules. To implement these guidelines, the CPCSEA appointed its nominees, usually people who were animal right’s activists themselves or cared about animals.
